

Decision Brief — Where Should “Operations” Checks Live?

Saagar Audit App · Phase 2 (Weekly Audit) setup · one decision needed from you

Prepared for: Store Owner

Prepared by: Development Team Lead

Date: 26 September 2026

The decision, in one line

The audit app organises every check into **folders** (we call them SOPs) so you can see, over time, which part of the store is strong or slipping. We currently have **8 folders**. The new weekly audit adds a group of **10 “Operations” checks** — things like rent paid on time, licences valid, fire-safety AMC current, staff training done, POS/billing system working. These don’t naturally belong to any existing folder. So: **do we tuck them into the existing “Service” folder, or give Operations its own folder?**

Important: your scores and your weekly report look identical either way. This choice only changes how clearly you’ll be able to **track Operations as its own trend** in the dashboards we build in the next phase.

The two options

Option A — Fold Operations into the existing “Service” folder

Upside

- Fastest to set up — no changes to the app’s structure.
- Fully reversible later if you change your mind.
- Keeps the “8 folders” design exactly as it is today.
- Scores and the weekly report are 100% unaffected.

Downside

- Your “Service” score stops meaning one clean thing — it now moves because of rent, licences and safety too, not just customer handling.
- No single line to watch that says “my back-office is slipping.”
- The app’s auto-alert for a rotting area becomes less reliable on the Service folder.
- In your history, a rent problem gets filed as a “Service” issue — muddies who’s accountable.

Option B — Give Operations its own dedicated folder

Upside

- A clean, separate “Operations health” trend line — rent, licences, safety tracked on their own.
- Early-warning signal for money/compliance risk stays sharp.
- Failures and fixes are labelled correctly in your records.
- Scores and the weekly report are 100% unaffected.

Downside

- A bit more setup work now (we update the rulebook, the app data, and run one safe migration).
- Adds a 9th folder — a small change to the original “8 folders” design.
- Slightly more to review before we start building.

What does NOT change either way — so you’re not risking anything:

- Your weekly percentage and all scores stay exactly correct.
- The weekly report still prints “Operations” as its own line.
- Nothing about offline use or past locked audits changes.

Side-by-side

What matters to you	Fold into Service (A)	Own folder (B)
Setup effort now	Lowest — nothing to restructure	Small — one guided update + migration

Scores / weekly % correct	Yes	Yes
Weekly report shows Operations	Yes	Yes
Clean “Operations” trend graph	No — mixed into Service	Yes — stands alone
Reliable auto-alerts per area	Weaker on Service	Strong
Correct labelling in history	Ops filed under Service	Ops filed as Ops
Reversible later	Yes	Yes

Our recommendation

Option B — give Operations its own folder. The whole point of this app is to show you, at a glance, where the store is slipping. Operations is exactly the high-value zone — rent, licences, fire-safety, billing uptime — where you'd most want an early warning before it costs you money. The extra setup is small and one-time, and the benefit is permanent. That said, **Option A is a perfectly safe, fast shortcut** if you'd rather move quickly now and revisit later — it costs you nothing on scores today, only clarity in future dashboards.

Your decision

- ☐ Option A — Fold Operations into the Service folder (fastest)
- ☐ Option B — Give Operations its own folder (recommended)

Once you pick, the team will proceed and hold the work for a technical review before anything is finalised.
